

# INFORMATIONAL DATA TECHNOLOGIES SEEKS NEW PARTNERS IN VARIOUS INDUSTRIES

FEBRUARY 1, 2021 - WATERTOWN, SOUTH DAKOTA

Informational Data Technologies (IDT), an AMR/AMI data collection and delivery company, is seeking partnerships in the water, wastewater, agricultural, and energy industries to promote the value of AMR/AMI services.

IDT currently offers satellite-based and cellular-based platform for data collection and delivery. The two products together provide one-hundred percent coverage in all areas, especially the more rural areas where AMR/AMI has previously been unavailable.

"The IDT solution has the ability to solve water loss and management issues across several markets. We are looking for companies like engineering firms, distribution companies, and like-minded companies to educate these markets and get this technology in the hands of people that need it most," said Nick Polsinelli, Director of Sales and Channel, regarding the company's need for partnerships across multiple markets.

IDT currently partners with Verizon Wireless to provide cellular connectivity as well as Orbcomm to provide the satellite network. IDT is also partnered with the Texas A&M Agrilife extension for monitoring and researching water use and evaporation as well as the North Dakota Water Commission for SOAP and water management.

IDT is dedicated to educating companies on the value of automated meter reading and advanced metering infrastructure to understand how these technologies hold the key to loss mitigation and water conservation. IDT hopes that companies who share in the mission to evolve water conservation and monitoring and/or expand education will become a partner to further this endeavor.
